Conceptual Architecture - with Kafka as the Backbone

Stream Windows

Apache Kafka was born in LinkedIn and later became an open source Apache project in 2011, then a first-class Apache project in 2012. Kafka is written in La Scala and Java. Apache Kafka is a publishing-subscribe fault tolerant messaging system. It is fast, scalable and distributed by design. This tutorial will explore Kafka principles, installation, operation and then guide you through the Kafka cluster distribution. Finally, it will end with real-time applications and integration with Big Data technologies. Public This tutorial was prepared for professionals who aspire to make careers in Big Data analysis using the Apache Kafka messaging system. It will give you enough understanding about how to use Kafka clusters. Prerequisites Before proceeding with this tutorial, you must have a good knowledge of Java, Scala, distributed messaging system and Linux environment. Apache Kafka Tutorial provides the basic and advanced concepts of Apache Kafka. This tutorial is designed for beginners and professionals. Apache Kafka is an open-source stream-processing software platform that is used to manage data storage in real time. It works as a mediator between two parts, namely, a sender and a recipient. It can manage about trillion data events in one day. Apache Kafka tutorial journey will cover all concepts, from its architecture to its main concepts. What is Apache Kafka Apache Kafka is a software platform based on a distributed streaming process. It is a publishing-subscribe messaging system that allows data exchange between applications, servers and processors as well. Apache Kafka was originally developed by LinkedIn, and later donated to the Apache Software Foundation. It is currently maintained by Confluent under the Apache Software Foundation. Apache Kafka solved the letargical problem of communication between a sender and a receiver. What is a messaging system A messaging system is a simple exchange of information between two or more people, devices, etc. A public subscription messaging system allows the sender to send/write the message and a receiver to read that message. In Apache Kafka, a sender is known as a writer who publishes messages, and a receiver is known as a consumer who consumes that message by subscribing to it. A streaming process is the processing of data in parallel connected systems. This process allows several applications to restrict parallel data execution, where a record is executed without waiting for the previous record to be output. Therefore, a distributed streaming platform allows the user to simplify the task of the streaming process and parallel execution. Therefore, a streaming platform in Kafka has the following key features: As soon as the record streams occur, it processes it. It works similar to a corporate messaging system where it publishes and subscribes to record streams. It stores record streams in a durable and tolerant way. To learn and understand Apache Kafka, aspirants should know the following four main APIs: This API allows/allows an application to publish record streams on one or more topics. (discussed in the next section) Consumption APIs: This API allows an application to subscribe one or more topics and process the stream of records produced to them. Streams API: This API allows an application to efficiently transform input streams to output streams. Allows an application to act as a stream processor that consumes an input stream from one or more arguments, and produce an output stream to one or more output arguments. Connector API: This API runs the reusable manufacturer and consumer APIs with existing data systems or applications. Why Apache Kafka Apache Kafka is a software platform that has the following reasons better describes the need for Apache Kafka. Apache Kafka is able to manage millions of data or messages per second. second.Kafka works as a mediator between the source system and the destination system. So, the source system data (producer) are sent to the ApaPache Kafka, where the data decouples, and the destination system (consumer) consumes data from Kafka. Apache Kafka is having extremely high performance. ie, it has a very low latency value less than 10ms that shows it as a well-diversified software. Apache Kafka has a resilient architecture that has solved unusual complications in data sharing. Organizations such as Netflix, Uber, Walmart, etc. And over thousands of such companies make use of Apache Kafka. Apache Kafka is able to maintain error tolerance. Default tolerance means that sometimes a consumer successfully consumes the message that was delivered by the manufacturer. But, the consumer fails to process the message again due to the backend database failure, or due to the presence of a bug in the consumer code. In this situation, the consumer is not able to consume the message again. As a result, Apache Kafka has solved the data re-processing problem. Learning Kafka is a good source of income. Thus, those who wish to increase their income in the future in the IT sector can learn. Prerequisite aspirants should have a basic knowledge of Java programming, and a certain knowledge of Linux commands. This Apache Kafka trip has been designed for beginners, developers and people who want to learn new things. Problems make sure you will find no problem in this Apache Kafktutorial. But if there is any mistake, please send the problem into a contact form. The next topickafka topics May 22, 2017 · Database SQL - Data Types SQL data types ... Apache Kafka - Fundamentals.
