As an application, Facebook rarely if ever crashes, or doesn't perform as expected. The ease of use isn't solid and it has many useful features and uses. Communication and the ability to stay connected with friends and family is straight forward and easy to learn, even for older users. Simple feeds and posts are it's hallmark. X on the other hand limits it's posts with a short amount of space. Threads have improved Facebook to allow it to be competitive with Tik Tok, but it could use some improvements as far as screening racist content and how it goes about self-regulating itself. Too much misinformation is allowed to be posted and the reporting system needs improvement. Also, I have seen a huge uptick in scammers and fake accounts. Facebook has a reputation for allowing fraudulent advertisers and unscrupulous web stores. The level of trust users have ordering products from Facebook approved and sponsored companies is it's Achilles heal. Too many scam companies and scammer accounts on Facebook leads to consumer skepticism and lack of trust buying products on-line. Artificial Intelligence will only get better in the near future and I don't feel confident in Mark Zuckerberg's ability to adapt and keep Facebook safe from bots, scammers, and nefarious AI entities. Let's hope I am wrong. We're introducing passkeys on Facebook for mobile devices, offering another tool to safeguard your privacy and security. Passkeys are a new way to verify your identity and log in to your account that's easier and more secure than traditional passwords. Passkeys will soon be available on iOS and Android mobile devices for Facebook, and we will begin rolling out passkeys to Messenger in the coming months. The same passkey you set up for Facebook will also work on Messenger once this capability launches. What is a Passkey? Passkeys are secure digital credentials that act as alternatives for passwords. They allow you to log in to websites and apps securely by verifying it's you using the fingerprint, face or PIN you use to unlock your device. Passkeys can give you peace of mind about your account's security - they can't be guessed or easily stolen. And once created, they make it faster and easier than ever to log in to Facebook, no memorized password needed. All you'll need is a compatible mobile device and a Facebook account. The technology behind passkeys was developed by the FIDO Alliance, an open industry association focused on reducing the world's reliance on passwords. Meta is an active member of the FIDO Alliance. Keeping Your Account Secure Passkeys are an upgrade in security compared to traditional passwords and one-time SMS codes because they are resistant to guessing or theft by malicious websites or scam links, making them effective against phishing and password spraying attacks. By using passkeys, you'll have increased protection against online threats while also simplifying your login experience. Passkeys and the fingerprint, face scan or PIN you use to create them are always stored on your device and we'll never see, share or store them. Do More with Your Passkey Passkeys aren't limited to logging in to your Facebook account. You'll also be able to use your passkey to securely autofill payment information when making purchases using Meta Pay, and eventually to log in to Messenger and protect your encrypted message backups. Setting Up Your Passkey Creating your passkey is easy and only takes a few simple steps. You can set up and manage your passkey in Accounts Center, found within the Settings menu on Facebook. You also may be prompted to set up a passkey when you log in to Facebook. Once it's set up, you'll be able to use your passkey moving forward to log in to Facebook on your mobile device. You'll still be able to use other authentication methods, such as your password, to access your account. That way you can still access your Facebook account when you're using a device that doesn't support passkeys yet. Learn more about creating or removing your passkey in our Help Center.
