Our research is on developmentally disabled MR/learning which is a broad group of severe chronic conditions (). These chronic conditions are due to mental and or physical impairments. Causes of developmental disabilities are from diverse factors such as heredity/genetics, negative pregnancy behaviors, infections the mother could have while carrying the child, and environmental factors while pregnant. Developmental disabilities occur in all races. Each year over 150,000 infants are born with a [developmental disability](#) in the United States.

Symptoms of developmental disabilities include delay in oral language, poor memory, trouble learning social rules, difficulty in self-help/self-care, and in cases physical characteristics. Developmental disabilities are usually caught early when the child is an infant and in their mother's womb. To determine a disability this early a prenatal testing is needed. There are two types of prenatal testing. The first type of prenatal testing is called a prenatal screening.

Prenatal screenings identify conditions your baby may have but it does not diagnose them. Screenings are done through use of blood or ultrasound. The use of a prenatal screening proposes no harm to the baby or the mother. The second type of prenatal testing is diagnostic tests. Diagnostic testing is a for sure way to be positive of a diagnosis. Diagnostic tests are performed when a prenatal screening shows a problem, the mother is

over age, or past family issues occur. One way to do a diagnostic test is through a chronic villus sampling or amniocentesis. A chronic villus sampling or amniocentesis both carry the chance of miscarriage. When a developmental disability is detected early in the pregnancy the mother has the choice to n...
