The user who performs any document containing VBA macros can preset the software with user preferences. End users can protect themselves from attack by disabling macros to be running in an application or ensuring permission for a document to run the VBA code only if they are sure that the document source can be reliable. The VBA version history was first launched with MS Excel 5.0 in 1993. It became an immediate success among developers to create business solutions using Excel. The inclusion of VBA with Microsoft project, access and substitution of words replacing theBasic and WordBasic access is made more popular respectively. VBA 4.0 is the next famous release with a totally up-to-date version compared to the previous one. Released in 1996, it is written in C++ and has become an object-oriented language. VBA 5.0 was launched in 1997 along with all MS products Office 97. The only exception for this was Outlook 97 which used VBScript. VBA 6.0 and VBA 6.1 were launched in 1999, especially with support for add-ons com in Office 2000. VBA 6.2 was released alongside Office 2000 SR-1. VBA 6.3 was released after Office XP. VBA 6.4 followed Office 2003 and VBA 6.5 was released with Office 2007. Office 2010 includes VBA 7.0. There are no new features in VBA 7 for developers compared to VBA 6.5 except for 64-bit support. However, after VBA 6.5 / Office 2007, Microsoft stopped VBA licenses for other applications. Office 2013, Office 2016 and Office 2019 include VBA 7.1. Development As of 1 July 2007, Microsoft no longer offers VBA distribution licenses to new customers. Microsoft intended to add .NET-based languages to .NET current version of VBA in tuneRelease of .NET Framework, [7] of which versions 1.0 and 1.1 included a scripting runtime technology called Script for .NET Framework. [8] Visual Studio .NET 2002 and 2003 SPK contained a separate scripting IDE called Visual Studio for applications (VSA) (VSA) VB.NET.[9][10][11] One of its significant features was that interfaces to the technology were available through Active Scripting (VBScript and JScript), which also enabled .NET-unaware applications to be scripted through .NET languages. However, VSA has been deprecated in version 2.0 of the .NET Framework,[11] not leaving a clear upgrade path for applications that want active scripting support (although scripts can be created in C# VBScript, and others). .NET languages, which can be compiled and executed at runtime via libraries installed as part of the runtime. Microsoft has left VBA support for Microsoft Office 2008 for Mac.[12][13] VBA has been restored to Microsoft Office for Mac 2011. Microsoft has said it does not intend to remove VBA from the Windows version of Office.[14][15] With Office 2010, Microsoft introduced VBA7, which contains a true type of data pointer: LongPtr. This allows the referee of 64-bit address space. The 64-bit installation of Office 2010 does not support common MScOMCTL controls (TabStrip, Toolbar, Status Bar, Progress Bar, TreeView, ListView, ImageList, Slider, ImageComboBox) or MScOMCTL2 (Animation, UpDown, MonthView, DateTimePicker, FlatScrollBar,) so the 32-bit legacy code will not depend on the common 64-bit VBA code. This does not affect the 32-bit version of Office 2010. [16] VBA7 does not include a 64-bit version of the common controls, so it leaves developers with no means to migrate 64-bit VBA applications. Microsoft suggests contacting your software provider for 64-bit versions of VBA controls.
